Metrics-Based Process Mapping (MBPM) is a tactical-level, visual mapping approach that enables improvement teams to make effective, data-based decisions regarding waste elimination and measure ongoing process performance. The mapping technique, often used to drill down from a value stream map, integrates the functional orientation of traditional swim-lane process maps with time and quality metrics that are essential for designing improved processes.

Building on the success of its popular predecessor, Metrics-Based Process Mapping: An Excel-Based Solution, this updated edition takes readers to the next level in understanding processes and process improvement. Among the improvements to this edition, the book includes:

- Foundational content about processes—what they are and how they vary
- A description of the difference between value-stream and process-level maps
- New content about how to bridge the gap between your current state and your desired future state
- Tips for effective team formation and mapping facilitation
- An implementation plan for those using the mapping methodology as a standalone tool and not part of a Kaizen Event

The Excel-based tool included on the accompanying CD provides readers with a user-friendly way to electronically archive manually created maps in team settings for easier storage and distribution across your entire organization. While current and future state MBPMs are initially created during team-based activities using butcher paper and Post-its, the electronic maps serve as standard work documentation for the improved process, enabling training, communication, and process monitoring activities.

This flexible, user-friendly tool includes:

- A custom toolbar that simplifies map creation and editing
- Automated calculation of key metrics
- An audit feature to prevent mapping errors
- The ability to simulate how improvements will impact staffing requirements

**System Requirements:** The tool is intended for use on PCs using Excel 2003 or later—it will NOT function with earlier versions of Excel, or on Macintosh computers.

Introduction

In the five years since we published *The Kaizen Event Planner*, in which we introduced Metrics-Based Process Mapping (MBPM), and the four years since we released the Excel tool to electronically capture one’s results, Lean management practices have evolved. Where many of the early Lean books—and therefore field application—were heavily tools based, today’s Lean practitioners, consultants, researchers, and business leaders recognize that, while tools are necessary, they are not sufficient. As we’ve explored more deeply what makes Toyota and other outstanding organizations tick, we’ve recognized that operational excellence and lasting transformation are the result of developing deep organizational capabilities around problem solving and continuous improvement.

We’ve also learned that proficiency in process measurement and analysis remains low, which slows improvement and creates significant risk when attempting to solve problems. Without a clear understanding of current-state performance, which requires the use of key process metrics, improvement teams risk drawing inappropriate conclusions and making improvement that is neither effective nor measurable. Let us be clear: it’s impossible to make informed process design decisions and measure one’s progress without relevant metrics.

For these two reasons, we’ve decided to release a second edition of *Metrics-Based Process Mapping*, which includes additional content based on current thinking in applying Lean practices, user feedback, and our observation that, while many businesses are making headway on their journey to excellence, nearly all could benefit by improving how they improve. We’ve also decided to convert it from a CD product that focuses more heavily on the Excel documentation tool to a book that focuses more heavily on the mapping methodology, but also includes the Excel documentation tool (on the CD attached to the back cover).
The new content includes:

- Foundational content about processes—what they are and how they vary
- A description of the difference between value-stream and process-level maps
- Additional content about how best to bridge the gap between the current state and your desired future state, and how to manage processes once improvement’s been made
- A reminder that reducing mura (inconsistency) and muri (overburden)—initially overlooked in most Lean books—is as important as eliminating muda (waste)
- Tips for effective team formation and mapping facilitation
- On the Excel tool, we’ve added an implementation plan to aid those who are using the mapping methodology as a standalone tool and not part of a Kaizen Event

In Chapter 1, you’ll learn what a process is, how processes vary, and why process management is critical to organizational excellence.

Chapter 2 focuses on why we developed this method, how to use it, its benefits, and how process mapping fits into the overall Plan-Do-Study-Adjust improvement cycle. Chapter 3 addresses preparation for mapping, including team formation, logistics, and crafting a charter that serves as a planning and communication tool.

The step-by-step approach for creating a current-state map is covered in Chapter 4. Here, we also introduce the three key metrics you need to gain a deep understanding of current state—process time, lead time, and percent complete and accurate—and design an improved process that reduces both time metrics, while increasing process quality.

Chapter 5 provides guidance for designing and implementing improvements to your process, while recognizing that every process’s performance needs are different. To this end, we avoid prescription. We’ve also included some tips we use to counter resistance to improvement.

Chapter 6 serves as a user’s guide for the Excel tool included on the CD in the back of this book, should you opt to electronically archive your mapping team’s work and the new standard work for the improved process. And finally, Chapter 7 shows you how to monitor and continuously improve your processes, a step where organizations often falter.
As you begin reading, we encourage you to conduct an honest evaluation about where your organization currently sits in terms of process design, management, and improvement. We find that, even in organizations that have been applying Lean and/or Six Sigma practices for many years, processes remain largely undefined, riddled with waste, not monitored, and not continuously improved. The behaviors, habits, and practices that must be adopted in order to transform into an improvement-minded organization that performs at increasingly high levels are conspicuously absent in most companies, government agencies, and nonprofits. It’s time to change that. It’s time to put an end to organizational performance that limps along due to excess waste and confusion, the poor morale that results from poorly defined and managed processes, the leadership frustration and poor decisions that can result from not knowing how processes will perform tomorrow as compared to today, and customer experiences that make them more likely to turn elsewhere for solutions to their problems. It’s time to put an end to the organizational chaos that holds you back from performing at the levels you want and need to. It’s time to create a work environment that has fewer fires, happier employees, and the bandwidth to innovate and add customer value.

While this book provides the know-how for applying an effective tool for defining, improving, and managing processes, it does not include detailed content about how to create a culture where metrics-based process mapping is used as the means to build the organization discipline needed for continuous improvement. Ideally, nearly everyone in your organization knows how to create MBPMs and they are highly proficient in thinking about processes in terms of the three key metrics: process time, lead time, and percent complete and accurate.

Your ultimate goal is to operate with processes that are well-defined, error-proofed, standardized as much as is prudent, waste-free, documented, and regularly monitored. We’ve written this book and developed an Excel tool that has proven to be helpful to many. We hope you find this to be the case as well and welcome you to share your experiences by contacting Karen at www.ksmartin.com and Mike at www.mosterling.com.

Now, let’s get to it. There’s much to be done.
Chapter 1
What Is a Process?

How many times have you heard, said, or felt, “Well, that was a grueling process”? Whether you are grocery shopping, filing an insurance claim, or trying to get through the security line at the airport, we are surrounded by processes. Some go so smoothly we hardly take note; others can be downright painful.

In the work environment, processes are how all needs or requests are satisfied. More and more organizations are beginning to understand that they need to improve their processes. In fact, they need to be continuously improved. But before we can discuss how to improve processes, it is helpful to understand what a process is, what the common components are, the types of processes, and why process management is important.

Definition of a Process

Merriam-Webster defines a process as “a series of actions or operations conducing to an end.” Taking this definition to the next level, a process is a sequence of activities performed to design, produce, or deliver a good or service to an internal or external customer. In the Lean vernacular, processes are classified as either value-adding or non-value-adding as viewed through the eyes of an external customer. Non-value-adding processes are further classified as either necessary (essential for meeting business requirements) or unnecessary (nonessential). Necessary non-value-adding processes are sometimes referred to as value-enabling processes.
The individual steps one takes to get work done (or the specific tasks one performs) connect together to form processes, and processes connect together to create value streams, the way in which you deliver value to your customers. We discuss value streams in greater detail in Chapter 2.

**Process Components**

A process has three primary components: inputs, activities, and outputs. Process *inputs* may be verbal (phone calls and in-person requests), electronic (orders, reports, downloads, e-mail requests, etc.), physical (e.g., hard copy reports and forms, service parts, equipment, specimens for analysis, etc.), or human (people seeking a service). Process *outputs* are typically the product (good, service, or information) required by the customer of the process.

Process *activities* are the actions that are taken to convert inputs into outputs. Many of these activities could be classified as transformational (e.g., calculating a price in response to a request for a quote); other activities do not transform inputs but are still classified as work (e.g., moving a document from one person to another, etc.).

Documenting process inputs, activities, and outputs serves a variety of purposes. First, formally and clearly defining customer requirements and expectations is necessary to ensure that process outputs are properly designed and delivered. The quality of process outputs is directly related to the quality and consistency of process inputs and the process design itself. Second, understanding and documenting inputs and activities is necessary to identify and eliminate wasteful activities that add expense, slow delivery, erode quality, create unnecessary risk, and frustrate employees, customers, and other stakeholders. Finally, process documentation is also necessary for training process workers, measuring process performance, and serving as the foundation of continuous improvement.

**Types of Processes**

In considering process improvement, it is helpful to understand the different types of processes. Some processes involve a physical transformation such as repairing a computer or baking a cake. Other processes convey information such as a loan approval. And other processes transform information into knowledge such as the design of a new product or service.
What Is a Process?

Processes range from low to high variation. In a low-variation process, the inputs, activities, and outputs are fairly consistent—for example, processing loan payments or insurance claims. In higher-variation processes, the inputs, activities, and outputs may vary significantly, both in terms of the type of input, activity or output, and the time it takes to accomplish the work. Processes ultimately serve either internal or external customers, and receive initial inputs from either internal or external suppliers. For example, expense report processing serves an internal customer (the employee), whereas processing a credit application serves an external customer (the applicant). And, in some cases, the suppliers are both internal and external, as is found in an estimating process that requires cost inputs from both manufacturing and external subcontractors. And, in many office and service processes, the customer and the supplier may be one and the same, as is found in credit application and expense report processes.

Other ways in which processes can be differentiated include the frequency with which the process is performed (repetitive or one time), technology used (automated versus manual), and the mental processes involved (analytical versus rote).

Process Management

Processes that are properly defined, and executed will produce predictable results, and in today’s work environment, demands for well-executed processes are coming from all directions. External customers demand predictability in delivery and quality. To stay competitive, owners and managers constantly seek cost reductions, better quality, and faster delivery. The workforce wants greater engagement, reduced interpersonal and interdepartmental friction, and less frustration and stress while performing their jobs. Poor process management can hinder the realization of all of these needs. By understanding process inputs and focusing on improving how the work is done, outputs can be measurably improved. But improvement can only be achieved if you know how the process is performed, you can measure process performance, and you have the ability to see where the gaps exist within the process. This is where Metrics-Based Process Mapping comes into the picture.
